

2. Data Representation

CT1100 - J. Duggan

Lecture Overview

- “There are 10 kinds of people in the world - those who understand binary and those who don’t” (Anonymous)
- The most basic unit of information in a digital computer is called a bit **binary digit**
- A bit is nothing more than a state of “on” or “off”
- Topics
 - Positional Numbering Systems
 - Base 10, Base 2 and Base 16
 - Conversion between bases
 - Unsigned whole numbers
 - Character Codes (ASCII and Unicode)

Lecture Overview

- All numbering systems use positional notation
- Number denoted by its absolute value, multiplied by its positional value

1,336,347

1 3 3 6 3 4 7

1,000,000 100,000 10,000 1,000 100 10 1

Decimal Numbering Systems

- Decimal Base 10 / Radix 10
- For example 973_{10}
- The set of valid numerals for a positioning numbering system is equal in size to the radix of the system
- There are 10 digits in the decimals system (0-9), 2 in binary (0-1)

$$973_{10} = 9 \times 10^2 + 7 \times 10^1 + 3 \times 10^0$$

$$216_{10} = 2 \times 10^2 + 1 \times 10^1 + 6 \times 10^0$$

00	01	02	03	04	05	06	07	08	09
10	11	12	13	14	15	16	17	18	19
20	21	22	23	24	25	26	27	28	29

Binary Numbering Systems

- Two valid numerals (0 and 1)
- Base 2

$$011010_2 = 0 \times 2^5 + 1 \times 2^4 + 1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 0 \times 2^0$$

$$001111_2 = 0 \times 2^5 + 0 \times 2^4 + 1 \times 2^3 + 1 \times 2^2 + 1 \times 2^1 + 1 \times 2^0$$

000000	000001	000010	000011	000100
000101	000110	000111	001000	001001

The Scale of bits/bytes

Size	Term
Binary digit	bit
8 bits	byte
1024 (2^{10}) bytes	kilobyte
1,000 kilobytes	megabyte (million bytes)
1,000 megabytes	gigabyte (billion bytes)
1,000 gigabyte	terabyte (trillion bytes)

- A binary number with N bits can represent **unsigned integers** from 0 to $2^N - 1$
- For example, 15_{10} can be represented as 1111_2

Challenge 2.1

- Convert 10010011_2 to decimal
- Confirm the result with R (for example)

```
library(binaryLogic)
```

```
n1 <- as.binary(111,n = 8)  
n1
```

```
## [1] 0 1 1 0 1 1 1 1
```

- What is the maximum integer value (unsigned) for a 16 bit value?

Convert decimal to ternary

- Division/remainder technique, e.g. 104_{10} to base 3
- $104 / 3 = 34$ with a remainder of 2
- $34 / 3 = 11$ with a remainder of 1
- $11 / 3 = 3$ with a remainder of 2
- $3 / 3 = 1$ with a remainder of 0
- $1 / 3 = 0$, with a remainder of 1
- Reading the remainders from bottom to top we have $104_{10} = 10212_3$

Challenge 2.2

- Convert 15_{10} to binary
- Confirm the result with R

```
library(binaryLogic)
```

```
n1 <- as.binary(15,n = 4)
```

Binary Addition

- Facts for binary addition
 - $0 + 0 = 0$
 - $0 + 1 = 1$
 - $1 + 0 = 1$
 - $1 + 1 = 0$ 'and carry 1' = 10
 - $1 + 1 + [\text{carry}] = 1$ 'and carry 1'
- Need to make sure there is enough space (otherwise "overflow")

Decimal

Binary

19

10011

00111010

+ 17

+10001

+00011011

Binary Subtraction

- Our desire with computer arithmetic is to minimise the types of operations required
 - so we have devised a way to subtract using addition!
- We do this using complementary arithmetic
 - instead of $a - b$, think of $a + (-b)$
 - we find a way to express a number as negative, then add it
- To express a binary number as negative, get the *twos complement*
 - flip the bits and add 1
 - Then add, and throw away any high order bits

	Decimal	Binary	Twos Complement	Delete Higher Bit
	8	1000	1000	
-	3	0011 →	1101	
=	5		10101 →	0101

Challenge 2.3

- Add 4_{10} and 11_{10} in binary
- Subtract 8_{10} from 15_{10}

Representing Text

- ASCII
 - American Standard Code for Information Interchange
 - 8-bit, limited character set - built around Latin alphabet
 - 32 control characters, 10 digits, 52 letters (upper & lower), 32 special characters and the space character.
- Unicode
 - attempts to represent characters in every language
 - Uses 16 bits per character and is a superset of ASCII

ASCII Codes (0-127)

Challenge 2.4

Show that the following code makes sense, by converting the hexadecimal numbers to decimal.

```
charToRaw("Hello World")
```

```
## [1] 48 65 6c 6c 6f 20 57 6f 72 6c 64
```

Unicode

Types	Description	# Chars	Hex Vals
Alphabets	Latin, Cyrillic, Greek etc.	8192	0000-1FFF
Symbols	Dingbats, Mathematical etc.	4096	2000-2FFF
CJK	Chinese, Japanese, Korean	40,960	4000-DFFF
Han	Unified Chinese, Japanese, Korean	4096	3000-3FFF
	Expansion/spillover from Han	4096	E000-EFFF
User defined	Unified Chinese, Japanese, Korean	4095	F000-FFFE

Challenge 2.5

What kind of data might each of these variables be?

Time	Team	Scorer	From	Type	Points	Score
1	Dublin	Paul Mannion	Play	Point	1	1
2	Kerry	Sean O'Shea	Play	Point	1	1
3	Dublin	Dean Rock	Play	Point	1	2
4	Dublin	Dean Rock	Free	Point	1	3
10	Kerry	David Clifford	Play	Point	1	2
13	Kerry	Sean O'Shea	FortyFive	Point	1	3
14	Kerry	Stephen O'Brien	Play	Point	1	4
16	Dublin	Paul Mannion	Play	Point	1	4
18	Kerry	Sean O'Shea	Free	Point	1	5
19	Dublin	Jack McCaffrey	Play	Goal	3	7

Summary

- Key ideas
 - Positional numbering systems
 - Base 10, 16 and 2
 - Conversion processes
 - Addition & Subtraction of unsigned integers
 - Character codes
- Other Topics
 - Signed integers and negative numbers
 - Floating point representation
 - Multiplication and division
 - IEEE Floating Point Standard
- Next steps
 - High level languages hides many of these details
 - Easier to work with numbers and characters
 - We will explore these in R, e.g. variable types in a **tibble**
